How to measure the codes using Big O

5 Rules

No	Description	Complexity
Rule 1	Any assignment statements and if statements that are executed once regardless of the size of the problem	O(1)
Rule 2	A simple "for" loop from 0 to n (with no internal loops)	O(n)
Rule 3	A nested loop of the same type takes quadratic time complexity	O(n ²)
Rule 4	A loop, in which the controlling parameter is divided by two at each step	O(log n)
Rule 5	When dealing with multiple statements, just add them up	

may be complex enough to factor into the efficiency of an algorithm. You should be warned that some declarations may include initializations and some of these

Python range() Function

Definition and Usage

The range() function returns a sequence of numbers, starting from 0 by default, and increments by 1 (by default), and ends at a specified number.

Syntax

range(start, stop, step)

Parameter Values

Description	Optional. An integer number specifying at which position to start. Default is 0	Required. An integer number specifying at which position to end.	Optional. An integer number specifying the incrementation. Default is 1
Parameter	start	stop	step

Examples

Example 1

Create a sequence of numbers from 0 to 6, and print each item in the sequence:

```
range (7):
       print (n)
n in
for
```
